

jane_street_kaggle

December 19, 2020

1 INTRODUCTION:

The dataset is taken from jane street market competition. The goal of the below models is to predict whether each input vector is a trading opportunity or not. In the following report, we will see how kaggle's favourite XGBoost model compare to a 2-layer logistic regression model, and a simple 1-layer logistic model.

1.1 THE DATA:

The data is taken from train.csv file and parted into sets as discussed later. There are in total 130 features and 5 return values that determine whether a trade was profitable or not. In addition, there is weight associated with each entry. There is also date. Ideally, we want to study the features and find some form of bias. For example, feature 0 only consists either -1 or 1. In addition, we can use a combination of resp values and weight to represent its true resp.

However for the sake of time, we will ignore complexity and make this a simple binary classification problem. As seen later, we will use column 'resp' to claffify the trade/input as 0 (loss) or 1 (profit).

Lets dive into how the data is prepared for our model.

First we want to import all the necessary modules.

```
[2]: import pandas as pd
import numpy as np
import xgboost as xgb
from sklearn.metrics import classification_report
from sklearn.metrics import accuracy_score
```

We will load data from train.csv into pandas and print to verify.

```
[3]: df = pd.read_csv("train.csv")
print(df.head())
```

[5 rows x 138 columns]

Let us clean up the data.

1: Clear all 0 weighted rows

```
[4]: indexEmptyWeight = df[ df['weight'] == 0 ].index
df.drop(indexEmptyWeight, inplace=True)
print(df.head())
df.info(memory_usage='deep')
```

	date	weight	resp_1	resp_2	resp_3	resp_4	resp	\

8	1.778029	4.740577	8

```
[5 rows x 138 columns]
<class 'pandas.core.frame.DataFrame'>
Int64Index: 1981287 entries, 1 to 2390489
Columns: 138 entries, date to ts_id
dtypes: float64(135), int64(3)
memory usage: 2.1 GB
```

2: Below we will replace any NaN value with -999 (arbitrary)

```
[5]: df = df.fillna(-999)
```

3: Make sure columns are Numeric. We need to ensure our data is numeric before feeding it in XGBoosting.

```
[6]: print(df.dtypes)
```

```
date          int64
weight        float64
resp_1        float64
resp_2        float64
resp_3        float64
...
feature_126    float64
feature_127    float64
feature_128    float64
feature_129    float64
ts_id          int64
Length: 138, dtype: object
```

#Now that we made sure all the columns are numeric, let's define X and Y.

4: Create prediction columns

We can add additional column to df which will be our Y ("label"). label will contain 1 if resp (return) is positive or 0 if it is negative.

```
[7]: df.loc[df['resp'] > 0, 'label'] = 1
df.loc[df['resp'] <= 0, 'label'] = 0
print(df.head())
```

date	weight	resp_1	resp_2	resp_3	resp_4	resp \

7	4.429745	7	1.0
8	4.740577	8	0.0

[5 rows x 139 columns]

5: Create Y_train

Extracting 'label' column to Y_train:

```
[8]: Y_train = df['label']
      print(Y_train.shape)
```

(1981287,)

6: Obtain X_train

Extracting columns that contain the keyword 'feature' to X_train:

```
[9]: X_train = df.loc[:, df.columns.str.contains('feature')]
      X_train = X_train.fillna(-999)
      for column in X_train.columns:
          X_train[column] = pd.to_numeric(X_train[column])
      print(X_train.shape)
```

(1981287, 130)

7: Split the data train-test-val

Now lets do a data split. We will be splitting 4/1 (train/test).

```
[10]: from sklearn.model_selection import train_test_split

X_train, X_test, Y_train, Y_test = train_test_split(X_train, Y_train,
↳random_state=42, stratify=Y_train)
```

We should split once again to obtain validation set. Once again it will be default 4/1 (train/val)

```
[11]: X_train, X_val, Y_train, Y_val = train_test_split(X_train, Y_train,
↳random_state=42, stratify=Y_train)
```

When doing the split we want to ensure the proportion of our Y is relatively same. That is why we used sklearn's train_test_split.

We can confirm that the split is constant by following:

```
[12]: print(sum(Y_val)/len(Y_val))
print(sum(Y_train)/len(Y_train))
print(sum(Y_test)/len(Y_test))
```

```
0.5044119388842828
0.5044132966882104
0.5044132907482405
```

Let's free up space for future objects

```
[13]: del df
```

Our data is ready for classifiers.

2 Models

2.1 Dummy Classifier

We will train dummy classifier

```
[33]: from sklearn.dummy import DummyClassifier
dummy_clf = DummyClassifier(strategy="most_frequent")
dummy_clf.fit(X_train, Y_train)
```

```
[33]: DummyClassifier(strategy='most_frequent')
```

```
[34]: dummy_y = dummy_clf.predict(X_test)
```

```
[41]: print(classification_report(Y_test, dummy_y))
print("Accuracy: ", accuracy_score(Y_test, dummy_y))
```

	precision	recall	f1-score	support
0.0	0.00	0.00	0.00	245475
1.0	0.50	1.00	0.67	249847

accuracy			0.50	495322
macro avg	0.25	0.50	0.34	495322
weighted avg	0.25	0.50	0.34	495322

Accuracy: 0.5044132907482405

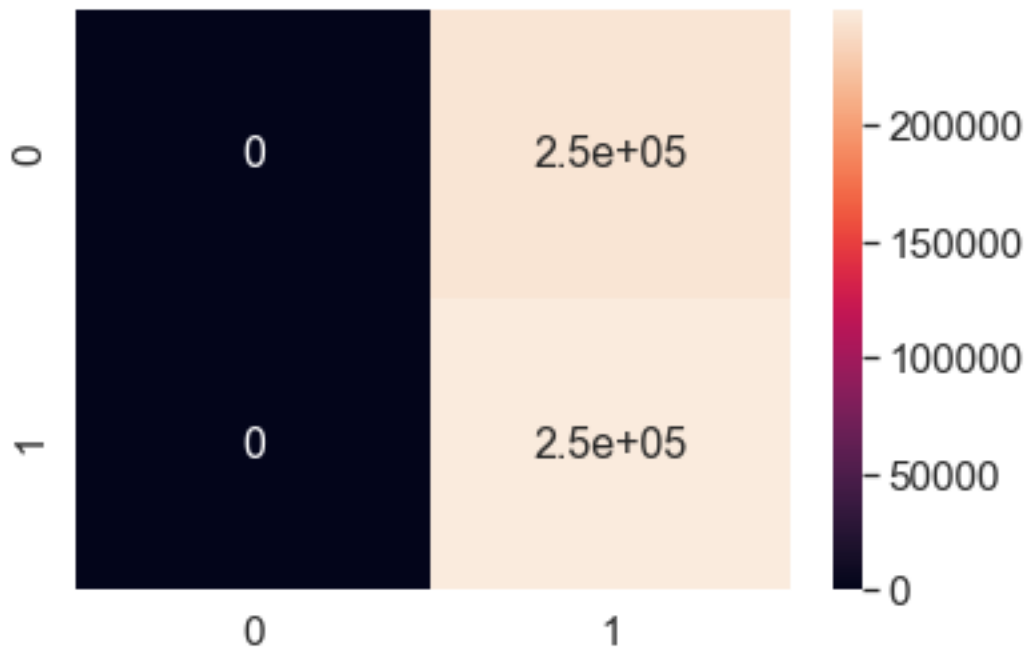

```
[39]: from sklearn.metrics import confusion_matrix
cm_dummy = confusion_matrix(Y_test, dummy_y)
print(cm_dummy)
```

```
[[ 0 245475]
 [ 0 249847]]
```

```
[40]: import seaborn as sn

df_xgb = pd.DataFrame(cm_xgb)
# plt.figure(figsize=(10,7))
sn.set(font_scale=1.4) # for label size
sn.heatmap(cm_dummy, annot=True, annot_kws={"size": 16}) # font size

plt.show()
```

2.2 XGBoost

Below we will tune our hyperparameters for XGBoost. We will optimize `n_estimators`, `learning_rate`, `max_depth`.

We will be using `GridSearchCV`

```
[25]: from sklearn.model_selection import GridSearchCV

param_grid = {
    'n_estimators': [600, 1000, 1200],
    'learning_rate': [0.01, 0.05, 0.005],
    'max_depth': [6, 11, 15]
}

optimal_param = GridSearchCV(estimator=xgb.XGBClassifier(objective='binary:
    ↳logistic', missing=-999,
                                ↳
    ↳tree_method='gpu_hist', subsample=0.50, colsample_bytree=0.50),
                             param_grid=param_grid, scoring='roc_auc'
                             )
```

```
[26]: optimal_param.fit(X_train, Y_train, verbose=True, early_stopping_rounds=10,
    eval_metric='auc', eval_set=[(X_val, Y_val)])
```

```
[0]    validation_0-auc:0.52322

Stopping. Best iteration:

[570] validation_0-auc:0.57882

[0] validation_0-auc:0.52322

Will train until validation_0-auc hasn't improved in 10 rounds.

Stopping. Best iteration:

[570] validation_0-auc:0.57882

[0] validation_0-auc:0.52322

Will train until validation_0-auc hasn't improved in 10 rounds.
