```
[26]: import matplotlib.pyplot as plt
fig, ax = plt.subplots()
ax.plot(x_axis, results['validation_0']['auc'], label='Validation')
ax.legend()
plt.ylabel('Classification AUC')
plt.title('XGBoost Classification AUC')
plt.show()
```

We can use the classification report from sklearn to get better grasp on our result. We will later use this report and compare with the reports generated by other models.

```
[17]: print(classification_report(Y_test, Y_prediction_xgb))
print("Accuracy: ", accuracy_score(Y_test, Y_prediction_xgb))
```

	precision	recall	f1-score	support
0.0	0.61	0.58	0.59	245475
1.0	0.60	0.63	0.62	249847
accuracy			0.60	495322
macro avg	0.60	0.60	0.60	495322
weighted avg	0.60	0.60	0.60	495322

Accuracy: 0.6039445047867852

Confusion matrix:

```
[27]: cm_xgb = confusion_matrix(Y_test, Y_prediction_xgb)
      print(cm_xgb)
```

```
[[141775 103700]
 [ 92475 157372]]
```

```
[31]: df_xgb = pd.DataFrame(cm_xgb)
      # plt.figure(figsize=(10,7))
      sn.set(font_scale=1.4) # for label size
      sn.heatmap(df_xgb, annot=True, annot_kws={"size": 16}) # font size

      plt.show()
```

2.3 1-LAYER LOGISTIC REGRESSION

Lets import all the additional necessary files for logistic regression. We will be using keras from tensorflow to train and predict our data.

```
[102]: import tensorflow as tf
      from tensorflow import keras
      from tensorflow.keras import layers
      from tensorflow.keras.models import Sequential
      from tensorflow.keras.layers import Dense, Dropout
      from tensorflow.keras.wrappers.scikit_learn import KerasClassifier
      from tensorflow.keras.optimizers import Adam
      from sklearn.model_selection import GridSearchCV
```

As we did with the XGBoost, we want Keras to use our GPU to speed up the process.

```
[14]: print("Num GPUs Available: ", len(tf.config.experimental.  
    ↳list_physical_devices('GPU')))  
print(tf.test.is_built_with_cuda())  
tf.config.experimental.list_physical_devices('GPU')
```

```
Num GPUs Available:  1  
True
```

```
[14]: [PhysicalDevice(name='/physical_device:GPU:0', device_type='GPU')]
```

When we trained our model, the model would eat up RAM around epoch 40. After searching, we found multiple user having the same memory leak issue with the current version of TensorFlow.

To solve this, we will override the `on_epoch_end` method from Callback and call garbage collector (<https://github.com/tensorflow/tensorflow/issues/31312#issuecomment-575989061>).

```
[103]: import gc  
  
class MyCustomCallback(tf.keras.callbacks.Callback):  
    def on_epoch_end(self, epoch, logs=None):  
        gc.collect()
```

We will define model compilation function below.

Params:

Optimizer: we will use the famous Adam's optimization

Loss: Our loss will be a goto crossentropy for classification problem

Metrics: We will use AUC similar to our XGBoost model.

```
[105]: def create_logreg(learning_rate):  
    model = Sequential()  
    model.add(layers.Dense(1, activation='sigmoid', input_dim=X_test.shape[1]))  
    adam = Adam(lr = learning_rate)  
    model.compile(loss = 'binary_crossentropy', optimizer = adam, metrics = [  
    ↳keras.metrics.AUC()])  
    return model
```

We will be optimizing two parameters. One is the epoch and other the learning rate

```
[106]: learning_rate = [0.001,0.01,0.1]  
epochs = [200, 500, 700]  
  
# Make a dictionary of the grid search parameters  
  
param_grids = dict(learning_rate = learning_rate, epochs = epochs)
```

The tuning process take more than couple of hours so we will opt in to tune only on a subset of data points

```
[107]: _, X, _, Y = train_test_split(X_train, Y_train, random_state=42,
↳stratify=Y_train, test_size=100000)
_, XV, _, YV = train_test_split(X_val, Y_val, random_state=42, stratify=Y_val,
↳test_size=10000)
print(X_train.shape)
print(XV)
```

```
(1114473, 130)
```

[10000 rows x 130 columns]

We will tune the model using gridsearch

```
[108]: clf_logreg = KerasClassifier(build_fn = create_logreg,verbose = 1)
grid = GridSearchCV(estimator = clf_logreg, param_grid = param_grids,verbose = 1,
    ↳10, scoring='roc_auc')
grid_result = grid.fit(X, Y, batch_size=300, shuffle=True, validation_data=(XV,
    ↳YV), callbacks=[MyCustomCallback()])
```

Fitting 5 folds for each of 9 candidates, totalling 45 fits

[CV] epochs=200, learning_rate=0.001 ...

[Parallel(n_jobs=1)]: Using backend SequentialBackend with 1 concurrent workers.
